*The future of
preventative medicine*

WHAT IS HEALTHSCREEN?

HealthScreen is a next generation medical facility combining early detection and diagnosis with advanced imaging technology and an integrated, tailored preventative medicine program.

The HealthScreen service, provided at the Hampton Day Hospital in Melbourne, is an Australian-first program which can provide you with a comprehensive report of your present and long-term health,

WHAT CAN HEALTHSCREEN HELP TO DIAGNOSE OR PREVENT?

HealthScreen assessments can help to identify the very early stages of some of the leading underlying causes of death for Australians over the age of 40 including coronary heart disease, cerebrovascular disease (stroke risk) and lung, colorectal, breast, prostate, pancreatic and ovarian cancer.¹

including risks and genetic predispositions for particular diseases and hereditary conditions.

HealthScreen combines the most advanced MRI technology and screening available with internationally renowned specialists to provide early detection and diagnosis of some of the most common causes of death for Australians over the age of 40.

A HealthScreen assessment will also provide you with a personalised wellness plan. This may include follow up appointments with specialists if required as well as actions you can take to support a healthier and longer life.

WHY SHOULD I GET A HEALTHSCREEN ASSESSMENT?

Standard physical examinations by a doctor and routine tests are limited in the information they can provide on your health. Advanced imaging technology can enable a comprehensive and truly detailed health assessment and potentially early diagnosis of existing medical conditions.

HealthScreen's comprehensive assessment can detect many early stage cancers, heart

disease, aneurysms, cerebrovascular disease and other conditions.

HealthScreen can provide you with advanced screening and possible early detection for 20 of the most common cancers - including lung, breast, colorectal and prostate - along with cardiovascular disease and stroke risk.

WHAT CAN I EXPECT?

During the HealthScreen process you will meet twice with our doctors.

The first consultation will be to undertake a comprehensive assessment of your full medical history, a physical exam including assessment for skin cancers and all advanced testing.

All testing is done on-site and in one day, including advanced screening and early detection of 20 of the most common cancers with the latest MRI targeted imaging technology, coronary heart disease assessment including Calcium Score and CT Coronary Angiography, cerebrovascular disease assessment, bowel cancer assessment and prevention, genetic screening*, advanced laboratory tests, body composition analysis, bone densitometry, and much more.

The exam can be customised to you with a broad range of elective options to address any specific concerns or medical problems.

After undergoing the screening tests, you will have a second extended consultation with a physician who will explain the results in-depth, organise any required follow ups with specialists and provide you with a comprehensive report of present and long-term health, including risks and genetic predispositions for diseases and conditions.

The physician will also explain your personal wellness plan.
